

Scenario 1 — Basic Plan (\$11), Small Claim, Approved

Full mechanics: see Step-1 through Step-5 . This document only states what's different for this specific case.

Values used

	Value
Policyholder	Alice, 0x1111...aaaa
templateId	1 (Basic)
coverageAmount	2_000 ether
Premium paid	11 ether (\$11)
policyId assigned	1
Claim amount	50 ether (\$50)
claimId assigned	1
Oracle decision	Approved (50 <= 100,000 mock threshold)
Final payout	50 ether to Alice

Walkthrough (deltas from the Step documents only)

- **Step 2** (subscribeToPolicy): templateId = 1 instead of 3 . policyTemplates[1] = { coverageAmount: 2_000 ether, premiumAmountPerPeriod: 11 ether, ... } . _collectPremium pulls 11 ether from Alice to the Treasury, not 33 .
- **Step 3** (submitClaim): amount = 50 ether . Coverage check: _consumedCoverage(1) + 50 ether (= 0 + 50 ether) <= 2_000 ether — passes with very large headroom.
- **Step 4** (oracle): declaredAmount = 50 , well under the mock threshold — approved, identical mechanics to the main trace.
- **Step 5** (payoutClaim): transfers 50 ether , not 221 ether . ClaimRegistry needs at least 50 ether in dUSD on hand — a much smaller prerequisite funding requirement than the \$221 trace.

End state

StableCoin balance change for Alice: -11 (premium) +50 (payout) = +39 ether net
claims[1].status: Paid
